

In May 2018, seasonally adjusted industrial production increased by 3.1 per cent over the previous month. When compared to May 2017, the index of industrial production adjusted for working days decreased by 1.1 per cent.

Index of Industrial Production: May 2018

Cut-off date:
2 July 2018

Monthly comparison

In May 2018, the seasonally adjusted index of industrial production increased by 3.1 per cent which was due to increases in all main industrial groupings. Production of capital goods, consumer goods, intermediate goods and energy increased by 3.9 per cent, 2.5 per cent, 1.5 per cent and 1.3 per cent respectively (Table 2).

Annual comparison

When compared to May 2017, the index of industrial production adjusted for working days decreased by 1.1 per cent. Decreases were registered in the production of consumer goods (2.0 per cent), intermediate goods (1.5 per cent) and capital goods (0.5 per cent). Production of energy increased by 6.4 per cent (Table 4).

Notes:

1. Table 4 shows % change compared to the corresponding month of the previous year.
2. The calculation of growth rates from the indices table may differ slightly from the published growth rates, due to rounding.

Methodological Notes

1. The Index of Industrial Production (IIP) is regarded as one of the most important measures of economic activity. Developments in the industrial production index describe the economic cycles of industry. For short-term statistics this index is the reference indicator for economic development and is used in particular to identify changes in trends at an early stage. The index of industrial production has been compiled since January 2000 and monitors the changes in the production of leading products from a sample of industrial enterprises. Such enterprises cover over 95 per cent of total industrial production.
2. A Laspeyres-type index is used for calculating the index of industrial production, with 2015 as base year.
3. The number of surveyed enterprises is about 200. 60 per cent of the activities covered by the index are calculated using the physical quantities method, 20 per cent are calculated using the deflated turnover approach, while the remaining 20 per cent are computed using the hours worked method.
4. The index numbers in this release are working-day and seasonally adjusted. These statistical methods aid interpretation of data by removing regularly recurring variations from a time series:
 - a. Working-day adjustment is a statistical method used to remove the calendar effect from an economic time series. The calendar effect is the variation caused by the changing number of working days in different months. The number of working days for a given month may depend on the timing of certain public holidays, the possible overlap between public holidays and non-working days, and the occurrence of a leap year. This method is used to compare data with the corresponding month of the preceding year.
 - b. Seasonal adjustment removes variation effects caused by the number of days in a month, holidays and particular events such as Christmas. Statistically, seasonal adjustment takes place after a time series has already been cleared of calendar effects by means of working-day adjustment. Seasonal adjustment is used to compare data with the preceding month.
 - c. In seasonal and working-day adjustments, the direct approach is used, meaning that each time series is adjusted on an individual basis.
5. The NSO has adopted methodologies and guidelines recommended by Eurostat and the International Monetary Fund (IMF).
6. The objective of Main Industrial Groupings (MIGs) is to provide an activity breakdown of industry (NACE Rev. 2 sections B, C, D and E). There are five MIGs which regroup all activities between NACE sections B to E covering the economic activities of companies in quarrying, manufacturing and energy.
7. The 2015 weights for the aggregates are shown below:

Main industrial grouping	Value added (%)
Intermediate goods	22.7
Energy	12.5
Capital goods	20.6
Consumer goods	44.2
Durable consumer goods	2.4
Non-durable consumer goods	41.8
Total	100.0

8. Figures for the past 26 months, inclusive of the reference month, are to be considered as provisional and therefore subject to revision.
