Note - By the above return it would appear that

Malta has a greater superficies than that given at page 190  
 in the return of Population &c. This apparent difference, how-  
 ever, may be accounted for as follows: The agricultural  
 return is made from reports sent in to Government by the  
 Deputy Suogotenenti of the several Casals, and those reports are  
 not made from actual measurement, but from verbal in-  
 formation given to these Officers by the tenants or proprietors of  
 the Land. Further an acre of land in Malta is not unfrequently  
 sown with three different crops in one year, and when this happens  
 that acre is put down in the return of Land in crop during the  
 Year, as three acres instead of one: this may also account for  
 the discrepancy which appears in the agricultural returns ge-  
 nerally. In addition to the above it may be observed that  
 computing the number of Acres in this return, in square miles  
 the Area must of necessity exceed that given at page 190, be-  
 cause the latter has been calculated on a trigonometrical  
 Survey of the whole Island, while the former professes to be the  
 actual superficies resulting from the measurement of the sepa-  
 rate portions of land, comprising the difference occasioned by  
 the undulations of the surface - for there can be no doubt that  
 a Country must measure less on a Map or plane surface than  
 when the inequalities of that Country are taken into account:  
 to ascertain correctly the superficies of the Island by the latter  
 mode of survey would be attended with great labour and expense.
