Note - By the above return it would appear that Malta

has a greater Superficies than that given at page 190 in the Return of Population &c. This apparent difference, however, may be accounted for as follows. The Agricultural return is made from reports sent in to Government, by the Deputy Surogetents of the several Casals, and these reports are not made from actual measurement, but from verbal information given to those Offices by the tenants or proprietors of the Land. — Further an acre of land in Malta is not unfrequently sown with three different crops in one Year, and when this happens that acre is put down in the Return of Land in Crop during the Year, as three acres instead of one: this may also account for the discrepancy which appears in the Agricultural returns generally. In addition to the above it may be observed that computing the number of Acres in this return, in square miles the Area must of necessity exceed that given at page 190, because the latter has been calculated on a trigonometrical Survey of the whole Island, while the former professes to be the actual superficies resulting from the measurement of the separate portions of land, comprising the difference occasioned by the undulation of the Surface. — For there can be no doubt that a Country must measure less on a Map or plane Surface than when the inequalities of that Country are taken into account: to ascertain correctly the Superficies of the Island by the latter mode of Survey would be attended with great labour and expense.
