

9 January 2015 | 1100 hrs | 006/2015

Seasonally adjusted industrial production decreased by 1.2 per cent in November over the previous month. When compared to November 2013, the index of industrial production adjusted for working days went down by 2.4 per cent.

Index of Industrial Production: November 2014

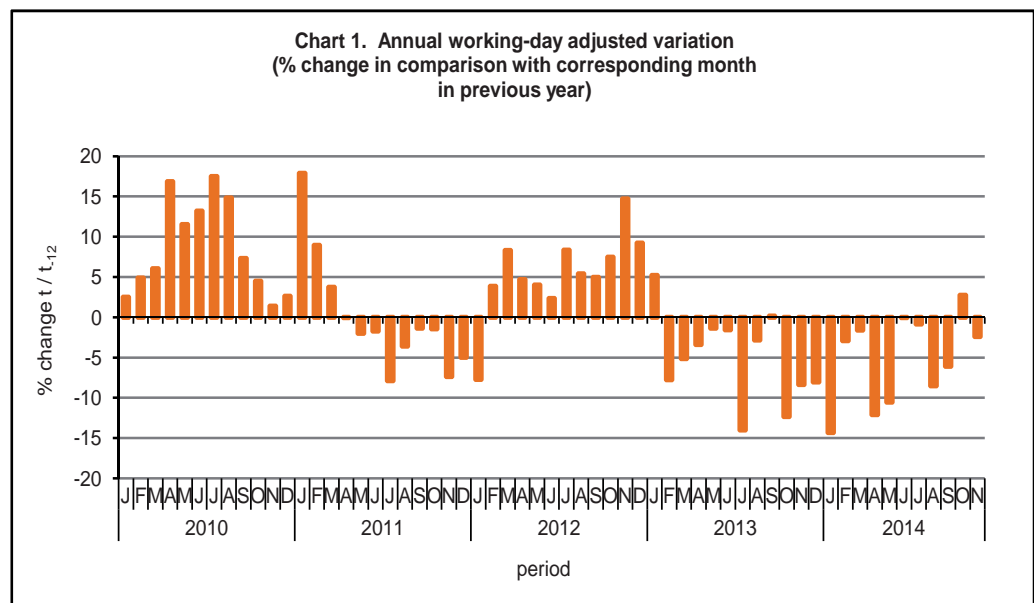

Cut-off date:
6 January 2015

Monthly comparison

In November, the seasonally adjusted index of industrial production decreased by 1.2 per cent to 95.1 points (Table 1). Decreases were registered in the production of intermediate goods (-3.3 per cent), capital goods (-0.2 per cent) and energy (-0.1 per cent). On the other hand, the production of consumer goods went up by 0.4 per cent (Table 2).

Annual comparison

When compared to the corresponding month in 2013, the index of industrial production adjusted for working days went down by 2.4 per cent. Decreases were registered in the production of intermediate goods (-16.1 per cent) and energy (-2.1 per cent). On the other hand, the production of consumer goods and capital goods went up by 5.4 and 5.0 per cent respectively (Table 4) ■

Methodological Notes

1. The Index of Industrial Production (IIP) is regarded as one of the most important measures of economic activity. Developments in the industrial production index describe the economic cycles of industry. For short-term statistics this index is the reference indicator for economic development and is used in particular to identify changes in trends at an early stage. The index of industrial production has been compiled since January 2000 and monitors the changes in the production of leading products from a sample of industrial enterprises. These sampled enterprises cover over 95 per cent of total industrial production.
2. The number of enterprises surveyed in this sample is around 180. Data on physical quantities are collected from 50% of these enterprises. Furthermore, 30% are estimated according to the number of hours worked and 20% have their turnover deflated by use of the Industrial Producer Prices.
3. Figures for the past 26 months, including the reference month, are to be considered as provisional and are therefore subject to revision.
4. The index numbers in this release are working-day and seasonally adjusted. These statistical methods aid interpretation of data by removing regularly recurring variations from a time series.
 - a. Working-day adjustment is a statistical method for removing the calendar effect from an economic time series. The calendar effect is the variation caused by the changing number of working days in different months. The number of working days for a given month may depend on the timing of certain public holidays, the possible overlap of certain public holidays and non-working days and the occurrence of a leap year. This method is used to compare data with the corresponding month of the previous year.
 - b. Seasonal adjustment removes variations which include effects due to month lengths, holidays and particular events such as Christmas. Statistically, seasonal adjustment takes place after a time series has already been cleared of calendar effects by way of working-day adjustment. This method is used to compare data with the previous month. In seasonal and working-day adjustments, the direct approach is used, meaning that each time series is adjusted on an individual basis.
5. A Laspeyres-type index is used for calculating the index of industrial production with 2010 as the base year.
6. The NSO has adopted methodologies and guidelines recommended by Eurostat and the International Monetary Fund (IMF).
7. The objective of Main Industrial Groupings (MIGs) is to provide an activity breakdown of industry (NACE Rev. 2 Sections B, C, D and E). There are five MIGs which regroup all the activities between NACE Sections B to E and cover the economic activities of companies in quarrying, manufacturing and energy.

The weights for the aggregates are shown below:

Main Industrial Grouping	Value added
TOTAL	100.0
Intermediate goods	35.8
Energy	16.3
Capital goods	11.7
Consumer goods	36.2
Durable consumer goods	2.9
Non-durable consumer goods	33.3
