

6 July 2016 | 1100 hrs | 105/2016

Seasonally adjusted industrial production increased by 0.3 per cent in May over the previous month. When compared to May 2015, the index of industrial production adjusted for working days went down by 3.3 per cent.

## Index of Industrial Production: May 2016

Cut-off date:  
4 July 2016

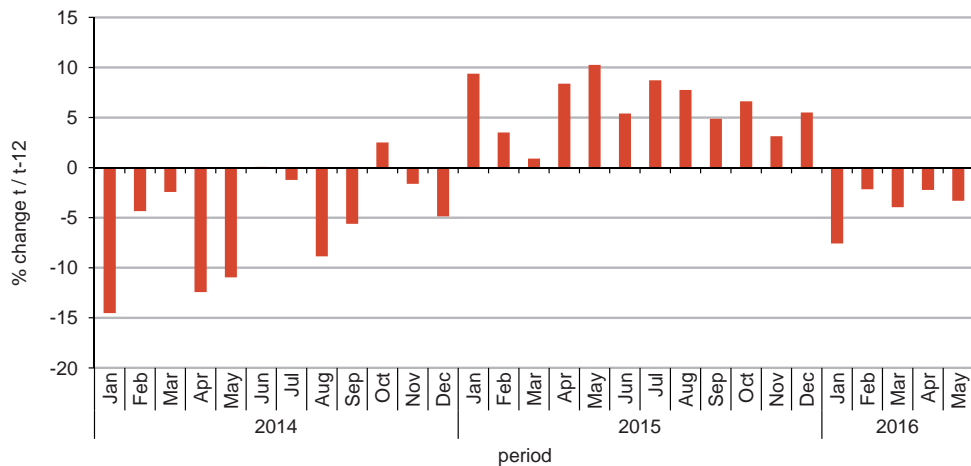

### Monthly comparison

In May, the seasonally adjusted index of industrial production increased by 0.3 per cent. Increases were registered in the production of intermediate goods (0.6 per cent) and energy (0.1 per cent). On the other hand, the production of consumer goods and capital goods went down by 3.4 and 1.0 per cent respectively (Tables 1 and 2).

### Annual comparison

When compared to the corresponding month of 2015, the index of industrial production adjusted for working days went down by 3.3 per cent. This was mainly due to decreases of 9.9 per cent in the production of intermediate goods and 4.2 per cent in the production of capital goods. On the other hand, increases were registered in the production of energy (2.6 per cent) and consumer goods (1.1 per cent) (Table 4) ■

## Methodological Notes

1. The Index of Industrial Production (IIP) is regarded as one of the most important measures of economic activity. Developments in the industrial production index describe the economic cycles of industry. For short-term statistics this index is the reference indicator for economic development and is used in particular to identify changes in trends at an early stage. The index of industrial production has been compiled since January 2000 and monitors the changes in the production of leading products from a sample of industrial enterprises. Such enterprises cover over 95 per cent of total industrial production.
2. A Laspeyres-type index is used for calculating the index of industrial production, with 2010 as base year.
3. The number of surveyed enterprises is about 180. Data on physical quantities are collected from 50 per cent of these enterprises. The number of hours worked is estimated on the basis of information from 30 per cent of the surveyed enterprises. Furthermore, 20 per cent have their turnover deflated by the use of industrial producer prices.
4. The index numbers in this release are working-day and seasonally adjusted. These statistical methods aid interpretation of data by removing regularly recurring variations from a time series:
  - a. Working-day adjustment is a statistical method used to remove the calendar effect from an economic time series. The calendar effect is the variation caused by the changing number of working days in different months. The number of working days for a given month may depend on the timing of certain public holidays, the possible overlap between public holidays and non-working days, and the occurrence of a leap year. This method is used to compare data with the corresponding month of the preceding year.
  - b. Seasonal adjustment removes variation effects caused by the number of days in a month, holidays and particular events such as Christmas. Statistically, seasonal adjustment takes place after a time series has already been cleared of calendar effects by means of working-day adjustment. Seasonal adjustment is used to compare data with the preceding month.
  - c. In seasonal and working-day adjustments, the direct approach is used, meaning that each time series is adjusted on an individual basis.
5. The NSO has adopted methodologies and guidelines recommended by Eurostat and the International Monetary Fund (IMF).
6. The objective of Main Industrial Groupings (MIGs) is to provide an activity breakdown of industry (NACE Rev. 2 sections B, C, D and E). There are five MIGs which regroup all activities between NACE sections B to E covering the economic activities of companies in quarrying, manufacturing and energy.
7. The weights for the aggregates are shown below:

Main industrial grouping	Value added
Intermediate goods	35.8
Energy	16.3
Capital goods	11.7
Consumer goods	36.2
Durable consumer goods	2.9
Non-durable consumer goods	33.3
<b>Total</b>	<b>100.0</b>

8. Figures for the past 26 months, inclusive of the reference month, are to be considered as provisional and therefore subject to revision.
