

11 May 2022 | 1100 hrs | 083/2022

In March 2022, the seasonally adjusted index of industrial production increased by 3.6 per cent over the previous month. When compared to March 2021, the working-day adjusted index of industrial production fell by 0.1 per cent.

Index of Industrial Production: March 2022

Cut-off date:
4 May 2022

Monthly comparison

After adjusting for seasonal effects and the working-day pattern, the index of industrial production increased by 3.6 per cent between February and March 2022. Increases were registered in the production of energy (8.5 per cent), consumer goods (4.9 per cent) and capital goods (2.6 per cent). The production of intermediate goods decreased by 0.3 per cent (Table 2).

Annual comparison

In March 2022, the total production generated by the Maltese manufacturing, energy, and mining and quarrying industries went down by 0.1 per cent when compared to March 2021. The production of consumer goods and intermediate goods decreased by 7.8 per cent and 1.8 per cent respectively whilst that of energy and capital goods increased by 15.1 per cent and 5.9 per cent respectively (Table 4). ■

Notes:

1. Table 4 shows percentage change compared to the corresponding month of the previous year.
2. The calculation of growth rates from the indices table may differ slightly from the published growth rates, due to rounding.

Methodological Notes

1. The Index of Industrial Production (IIP) is regarded as one of the most important measures of economic activity. Developments in the industrial production index describe the economic cycles of industry. For short-term statistics, this index is the reference indicator for economic development and is used in particular to identify changes in trends at an early stage. The index of industrial production has been compiled since January 2000 and monitors the changes in the production of leading products from a sample of industrial enterprises. Such enterprises cover over 95 per cent of the total industrial production.
2. A Laspeyres-type index is used for calculating the index of industrial production, with 2015 as the base year.
3. The number of surveyed enterprises is around 200. The activities covered by the index are the mining and quarrying, manufacturing and energy domains. 60 per cent are calculated using the physical quantities method, 20 per cent are calculated using the deflated turnover approach, while the remaining 20 per cent are computed using the hours worked method.
4. The index numbers in this release are working-day and seasonally adjusted. These statistical methods aid the interpretation of data by removing regularly recurring variations from a time series and are used as follows:
 - a. Working-day adjustment is a statistical method which is used to remove the calendar effect from an economic time series. The calendar effect is the variation caused by the changing number of working days in different months. The number of working days for a given month may depend on the timing of certain public holidays, the possible overlap between public holidays and non-working days, and the occurrence of a leap year. This method is used to compare data with the corresponding month of the preceding year.
 - b. Seasonal adjustment removes variation effects which are caused by the number of days in a month, holidays and particular events such as Christmas. Statistically, seasonal adjustment takes place after a time series has already been cleared of calendar effects by means of working-day adjustment. Seasonal adjustment is used to compare data with the preceding month.
 - c. In seasonal and working-day adjustments, the direct approach is used. The direct approach means that each time series is individually adjusted.
5. The NSO has adopted methodologies and guidelines which are recommended by both Eurostat and the International Monetary Fund (IMF).
6. The objective of the Main Industrial Groupings (MIGs) is to provide an activity breakdown of industry (NACE Rev. 2 sections B, C, D and E). There are five MIGs which regroup all activities between NACE sections B to E, covering the economic activities of companies in quarrying, manufacturing and energy.
7. The Energy production index includes the volume of output produced by statistical business units that are classified under NACE Divisions D35 and E36. The index excludes the electricity supply imported via the Malta-Sicily Interconnector.
8. The 2015 weights for the main industrial groupings are shown in the table below:

Main industrial grouping	Value added (%)
Intermediate goods	22.7
Energy	12.5
Capital goods	20.6
Consumer goods	44.2
Durable consumer goods	2.4
Non-durable consumer goods	41.8
Total	100.0

9. Figures for the past 26 months, inclusive of the reference month, are to be considered as provisional and therefore subject to revision.
10. As from the year 2018, the index has been re-referenced from 2010 = 100 to 2015 = 100. Hence, news releases with reference month January 2018 onwards, cannot be directly compared with those published beforehand.
